### REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance:

The Applicant claims a method for producing a solid polymer electrolyte membrane as described above, comprising a step of combining an anion group with a solid polymer membrane over a part of the surface of the membrane, which part is less than an entire surface of the membrane, wherein the membrane includes anion group combined regions and non-anion combined regions, and wherein the method further comprises steps of covering a portion of the solid polymer membrane with a mask; and applying radiation to the solid polymer membrane.

Applicant claims a method for producing a solid polymer electrolyte membrane comprising the steps of covering a portion on a surface of a polymer substrate with a first mask to shield the portion, applying radiation to an entirety of the substrate, grafting a styrene onto a polymer in a remaining portion in the substrate not converted by the first mask, removing the mask from the substrate, and combining an anion group with the styrene on the polymer in the grafted remaining portion of the substrate.

Applicant claims two other methods for producing a solid polymer electrolyte membrane as described in claims 4 and 5.

In the prior art of record, Nezu et al., U.S. Pat. No. 5,994,426, teach a solid polymer electrolyte membrane provided with ion exchangeability in a solid polymer electrolyte fuel cell by providing a membrane with sulfonic groups as anion groups. It also teaches a method of adding the sulfonic groups via the side groups by using radiation graft polymerization.

However, the prior art of record, taken either alone or in combination, fails to disclose or render obvious the mask features of independent claims 2, 3, 4, and 5.
